- 1. Dissolve ingredients (except carbonate, vitamins, lactate and sulfide), sparge medium with $100\%~N_2$ gas for 30 45 min to make it anoxic, then dispense under same gas atmosphere into anoxic Hungate-type tubes or serum vials and autoclave. After autoclaving complete the medium by adding vitamins (sterilized by filtration), lactate and sulfide from sterile anoxic stock solutions prepared under $100\%~N_2$ gas and carbonate from a sterile anoxic stock solution prepared under $80\%~N_2$ and $20\%~CO_2$ gas atmosphere. Adjust pH of the complete medium to 7.0 7.2, if necessary.
- 2. Note: Prior to inoculation 10-20 mg/l sodium dithionite (added from a 5% w/v solution freshly prepared under N_2 and filter-sterilized) can be added to the medium to stimulate growth at the beginning.
- * Replace lactate with 2.5 g/l Na-pyruvate added to the autoclaved medium from an anoxic stock solution sterilized by filtration and supplement medium with an additional amount of $1.0 \text{ g/l Na}_2\text{S}_2\text{O}_3 \times 5 \text{ H}_2\text{O}$ added from an anoxic stock solution sterilized by filtration.
